EuroGPT launches at Web Summit 2024

EuroGPT is an open source and privacy-conscious alternative to ChatGPT Enterprise

Web Summit Lisbon, November 12, 2024 - Ubicloud is excited to announce EuroGPT, an open source and privacy-conscious alternative to ChatGPT for businesses. Until today, businesses operating in Europe faced two challenges when integrating with AI applications. First, they had to use proprietary AI chat applications that offered limited transparency or control. Second, their data got shipped to the US, making them lose jurisdiction over this data.

EuroGPT overcomes these challenges. It's built as an open source solution, allows enterprises to keep their knowledge bases local, and runs large language models in Frankfurt, Germany.

Businesses can evaluate EuroGPT starting today at eurogpt.ubicloud.com.

Garry Tan, the President and CEO of Y Combinator, shared his enthusiasm by saying, "Innovation thrives on transparency and collaboration. What EuroGPT is doing -combining open-source infrastructure with the flexibility to control your own data- is exactly what we need in today's AI landscape."

EuroGPT combines open source and open weights solutions: Ubicloud's open source cloud, Meta's Llama 3.1 405B open model which is competitive with GPT 4o, Llama Guard 3 8GB for input and output moderation, and DuckDuckGo for privacy protected web searches.

The solution also offers enterprise-grade data privacy and security controls. EuroGPT allows enterprises to keep their knowledge bases private through use of local embedding models. It complies with GDPR and ensures all processed data remains within the EU.

Further, EuroGPT doesn't use any customer data for training purposes and offers custom data retention windows. It encrypts all data in transit and at rest. Thanks to open source, customers can validate these privacy and security controls.

All of these features are available to European businesses at 3x lower cost than comparable solutions in the US, starting today. For more information, please contact us at eurogpt@ubicloud.com.

Ubicloud

Ubicloud, the underlying cloud solution powering EuroGPT, is an open source cloud that can run anywhere. Customers can self-host the software or use managed services to reduce their cloud costs by 3x. For its managed services, Ubicloud relies on bare metal providers operating in Europe, including Hetzner, Leaseweb, and Latitude.sh.

Ubicloud co-founders, Umur Cubukcu, Ozgun Erdogan, and Daniel Farina, previously built Citus Data, which Microsoft acquired in 2019. Ubicloud went through the Y Combinator W24 program and raised a $16 million seed round earlier this year. The company has hundreds of customers on its managed cloud services.
